Project presentation

This project aims at creating myself an appealing portfolio for recruiters. Doing it will require me to:

- use my best projects to show my programming and analytic skills,
- show that I can keep up with industry trends,
- Show that I am capable of vulgarizing technical problems.

Challenges and goals

- The entreprise needs an experienced data analyst and demands a lot from candidates to prove their skills.
- My first goal is to create a convincing portfolio to showcase my skills the best to any employer.
- My second goal is to adapt this portfolio to the specific needs of Aeroworld.

SMART goals

- I showcase at least 1 project for each tool (coding language, software...) that I used in the OpenClassrooms course.
- I create and design a dashboard showing the technologies I follow and test.
- I create a "CV dashboard"
- I write and record a short course on ML hyperparameter optimization with Bayesian Search
- I create a procedure for creating visual representation of data.

Project team composition

I work on the project, I am helped by my tutor.

Ergonomic specification

- The portfolio will be based on my Github "portfolio" repository.
- The featured completed projects will have one file in the repository.
- The video tutorial will be in the linked of the ReadMe.
- The "CV dashboard" will be the first and main image of the ReadMe.
- The industry standard watch dashboard, the project management Gantt diagram, will be a static images in the ReadMe.

Functional specifications

- Most of the information will be available on Github, with a detailed ReadMe using static pictures.
- The notebooks and raw codes will be available in repositories with their own ReadMe
- Ressources that cannot be shown properly on Github (videos) will be linked in the the ReadMe description
- The portfolio only contains my own personal information that and is not regulated by the RGPD.

Technical and regulatory constraints

- Most of the portfolio will be on Github.
- The PowerBI dashboards cannot be hosted interactively in Github. The featured PowerBI project will be downloadable from Github and explained in a Loom video. The CV and BI dashboards will be integrated as static images to the main ReadMe.
- A video explaining my PhD project is available on youtube and will be linked.

Quality and performance

- The main ReadMe should be engaging and invite the reader to explore more. It should give clear guidance for the reader to find what they want.
- The rest of the dashboard should also be very clear.
- The portfolio should be finished by May 15th.

Retro-planning

- May 15th: The last recommendations from my tutor are implemented and the project is ready for validation.
- May 9th: I show the project that I consider finished and good enough to my tutor. He gives me new recommendations to improve quality if he has any.
- May 7th: The featured projects and simple deliverables are ready. I start writing and recording the video content.
- May 2nd: I frame the project more precisely with my tutor.
- April 30th: I start the project. I frame it and prepare the featured projects.
